Restaurant Orders Analysis: SQL Project

Overview:

This project analyzes restaurant order data using SQL to understand sales, customer behavior, and ordering trends. The dataset includes details like food items, categories, quantity, price, order time, and payment methods.

Database details:

- Database Name: `restaurant_orders`
- Table Used : `orders`

Columns:

- Order_ID
- Customer_Name
- Food_Item
- Category
- Quantity
- Price
- Payment_Method
- Order_Time

Questions:

1. Find the total revenue generated for each category.
2. Retrieve all orders where the payment method is 'Cash’.
3. Find the top 3 customers who spent the most money overall.
4. Get the total number of orders placed each day.
5. Display all records where quantity is greater than 2.
6. Find the most popular food item (highest total quantity sold).
7. Calculate the average price of items for each category.
8. List all unique payment methods used.

9. Find the hour of the day with the highest number of orders.

10. Get the total revenue for each payment method.

11. Show all orders where the category is 'Beverage’.

12. Find the top 5 most ordered food items (by number of orders, not quantity).

13. Find customers who have placed more than 3 orders and show their total spending.

14. Calculate the total quantity sold for each food item, sorted descending.

Thankyou
